 *Orbital trajectories, *Asteroids, Celestial mechanics.

A method is proposed for determining the radius of the
 circular orbit which is based on the replacement of the
 condition of the circular orbit $v_2 - v_1 = ka^{-3/2}$
 $(t_2 - t_1)$ by the approximate equality $\gamma = ka^{-3/2}$
 $(t_2 - t_1)$, where γ is the known angle between the
 geocentric directions. The value of the radius found
 from this condition is either a good first approximation,
 or (in the majority of cases) its final value. (Author)
